Unlike the geometry drawings and technical specs that design engineers use, AutoCAD's purpose is to convert information into drawings. When an engineer is preparing a drawing, their CAD operator starts with a template. The template contains a set of predefined dimensions and may have a title, which describes the template in some detail. The template is the foundation of the drawing. It defines the order of the elements that make up the final drawing. Once all the necessary dimensions are entered, the final drawing is prepared, including the placement of titles, legends, symbols, legends, layers, lines, and colors. The engineer then prints or exports the drawing. The template contains the order of the elements in the final drawing. AutoCAD's internal process of creating a template is dependent on the program's settings, such as drawing orientation (portrait or landscape), size of units of measurement, and unit of measure. When AutoCAD opens, the initial template will be in a default orientation and size. The user can choose to set AutoCAD to the desired orientation and size, and then set the unit of measure in the Preferences dialog. AutoCAD's internal process of creating a drawing is dependent on the program's settings. At startup, AutoCAD is set to create drawings in the desired orientation and size. This can be changed in the preferences. Once AutoCAD opens, the default template is the one named `_ACAD`. If the AutoCAD `_ACAD` template is missing, AutoCAD will automatically create a new template. Some changes can also be made to the `_ACAD` template, but these are designed to be a general, rather than an engineering, change.
