Introduction It's one of the most popular and used graphics software. Photoshop can do anything. From web design to commercial art, typography, product design, photo retouching, or image and video editing, Photoshop can do it all. There are three main versions of the Photoshop software that have significant differences in their features and performance. There is Photoshop, Adobe Photoshop Elements (Elements), and Adobe Photoshop Lightroom. Photoshop was developed by the company Adobe, who also sells the software and owns the rights to use the name Photoshop. It was originally called PhotoDraw and was developed in the early 1980s as a vector graphic editor for page layout, illustration and company logos. Later, it expanded to cover print layout, photographic image manipulation and digital photography, and now covers all of those. Adobe Photoshop Lightroom is a stand-alone software application that specifically focuses on organizing and editing digital photos. It does not contain any image-editing tools, only a database of metadata and a library for organizing images, making it easier to find or share. Photoshop Elements is a great alternative, if you want to spend less money. It comes preinstalled on most Windows and macOS computers sold since it was introduced in 2011. Adobe Photoshop Lightroom is a useful light alternative. Photoshop vs Photoshop Elements Adobe Photoshop is one of the most popular and used graphics software. Body strength profile of elderly black and white Americans. There is increasing evidence that resistance exercises are effective for preserving muscle strength in middle-aged and older individuals and for preventing the loss of muscle mass with age. Because aging is associated with a loss of muscle strength as well as with increased body fat, it is important to identify safe and effective resistance exercise programs that can be used by older adults. The purpose of this study was to assess the body strength profile of elderly black and white men and women. Body weights and submaximal, isokinetic strength (leg extension, leg flexion, leg press, and leg curl) were measured for 24 elderly men and women. The research was conducted in December 1992 and December 1993 in 2 community centers in Boston, Massachusetts. Subjects were drawn from the Boston University Longitudinal Study on Aging. The sample included 10 white men, mean age 77 yr (SD 5), who were residents of a senior center; 10 black women, mean age 78 yr (SD 6), who were residents of an Alameda County senior center; 8 white women, mean age 72 yr (SD 5), who were participants of the University of Michigan's Gerontology Research Center; and 4 black men, mean age 75 yr (SD 5), who were employees of the university. Isokinetic leg strength was measured at 60 degrees/sec. Leg extensor and flexor strength were significantly related to age, but there were no differences between black and white men. Leg press strength was significantly related to leg curl strength, and to leg press and leg curl speed in men and leg extension and leg curl strength in women. Body weight was not significantly related to leg extension and flexor strength, but was significantly related to leg press and leg curl strength in men. Leg press power was related to leg extension and leg flexor strength and was not significantly related to leg press speed in either men or women. The findings from this study suggest that leg extensions and flexors contribute approximately 25% of leg press strength and that leg press speed is most important for leg press power production. The data suggest that the leg press may be the most appropriate exercise for addressing issues of muscle mass preservation and maintenance of strength in elderly black and white men and women.

The ameliorative effect of sodium selenite on learning and memory impairments in experimental hypothyroidism. Hypothyroidism is a common endocrine disorder of the thyroid gland. In this study, we evaluate learning and memory defects in hypothyroid rats using Y-maze and Morris Water Maze tests and seek out any ameliorative effects of selenium in improving the memory deficit induced by hypothyroidism. Twenty-four adult male Wistar rats, weighing 250-300 g, were randomly allocated into six groups: hypothyroid, selenium-treated hypothyroid and controls. Se was administered in drinking water for a period of 4 weeks, beginning at 9 weeks of age. Hypothyroidism was induced by intraperitoneal injections of propylthiouracil (0.5 mg/100 g) at 9 and 10 weeks of age. The water maze was used to measure the latency to locate a submerged platform. The Y maze was used to measure the number of entries into arms with different angles. Selenium treatment was effective in ameliorating learning and memory impairment, as evidenced by increased mean escape latency, escape path, distance swum and number of entries into arms with different angles. Additionally, selenium treatment reduced expression of hypothyroidism-induced neurotoxic oxidative stress by restoring altered levels of superoxide dismutase and thiobarbituric acid-reactive substances in hypothyroidism. In conclusion, selenium treatment might be an effective therapeutic agent in hypothyroidism-induced memory dysfunction.
