- Pastebin.com.The present invention relates to an ink jet
printer, and more particularly, to an ink ejection head
and a method of ejecting ink from the head that
performs wiping of the ejection head. Ink jet printing

heads are used in various types of printers, such as in ink jet printers that print out computer generated documents, in plotters, and in high speed printers, such as in industrial and medical applications. Some of the different ink jet printing heads are shown in U.S. Pat. No. 5,355,384, 5,800,375, 6,618,966, and 6,613,014, the contents of which are incorporated herein by reference. In these printing heads, an array of nozzles is formed in a substrate and ink is ejected from a selected nozzle to form a dot on the page to be printed. The ink may be ejected from one of the nozzles as a stream of ink droplets, or as an ink jet stream or stream of droplets. The ejected ink often is drawn into a chamber from a fluid supply, such as an ink reservoir. A piezoelectric crystal is located in the chamber and may be activated to eject a droplet of ink from a nozzle, or to eject ink from a nozzle when a voltage is applied to the piezoelectric crystal. The printing head may be scanned across a recording medium to print a swath of information. The recording medium may be an incrementally moving web of paper, in which case the printing head is moved laterally across the width of the paper in successive swaths. Alternatively, the printing head may be moved laterally across the width of the paper or other recording medium, and the recording medium may be incrementally moved in a direction transverse to the direction of the print head. To print the swath of information, the print head is advanced to a new line and the recording medium is incrementally advanced so as to bring the swath of information into alignment with the print head, and then

the print head is activated c6a93da74d
